INTRODUCTION

Spherical Bessel functions of complex argument find application in scientific computations ranging from electronic circuit analysis to the understanding of nuclear and Mie scattering. Yet tables of Bessel functions are presently limited to spherical Bessel functions of real argument and to nonspherical Bessel functions of complex argument of 0 and 1 order. Tables of the former may be found in Abramowitz [1], and tables of the latter in Lowan [2]. The generation of spherical Bessel functions of complex argument is not a trivial problem, even with modern high-speed computers, because of difficulties associated with each of the methods used for their generation.

To surmount these difficulties, it became necessary to develop a method which would be simple and accurate for machine computation, and which would incorporate a terminating condition. The result was a method based on a continued fraction representation of the ratio of Bessel functions of consecutive order.

The purpose of this report is primarily to present the new method of calculating continued fractions, and secondarily to present tables of spherical Bessel functions of complex argument against which this method and others may be checked. The development is placed in perspective by reviewing the advantages and disadvantages of the other methods and algorithms which might be used. Suggestions are made relative to the extension of the method to other functions of complex argument.

RECURSION RELATIONS

Recursion relations are the simplest and most common method of generating Bessel functions. The fundamental recursion relation is

$$J_{v+1}(x) + J_{v-1}(x) = 2v/x J_v(x) \quad (1)$$

where J is the Bessel function of order v and complex argument x and $v = m+1/2$ where m is an integer. This relation may be used with two consecutive orders to generate all the necessary orders by starting at low order and recurring upward or starting at an approximate high order and recurring downward.

Unfortunately both of these methods have serious limitations. Lowan [2] has noted that the upward recursions are unstable when $2v/x$ is greater than unity, because the values of consecutive orders of

Bessel functions have common initial digits. Gautchi [3] has shown that the upward recursion has no digit accuracy after only seven recursions with 32-bit capacity for $x = 1.0$. Therefore, even using double precision arithmetic, the procedure will not work for more than a very few consecutive orders.

Miller's downward recursion scheme [4] has solved the problem of accuracy at the expense of machine time and storage. By starting with an approximate value for high orders, one can recur downward with only roundoff error. Since downward recursions start at a very high order for moderate arguments, this method is impractical when only a few orders are needed. This technique also suffers from the same problem that the forward recursion has - once accuracy is lost in a term, all the following terms have lost the same amount of accuracy. In this case, roundoff error may accumulate so that the more significant smaller orders are very much more inaccurate than the approximate initial high order.

INFINITE SERIES

The infinite series for Bessel functions is seldom used because the series is computationally divergent for moderate x and small orders. When the series does converge, it converges slowly, and it is difficult to program. Infinite series representations of Bessel functions are therefore mathematically interesting but not very practical for computation.

CONTINUED FRACTIONS

Continued fractions have the advantage of being simple, easy to program, and accurate for machine computation. Unfortunately, they have been neglected in favor of recursion relations because of difficulties in determining the accuracy of a given number of terms in a continued fraction. The following development of continued fractions is intended to review their basic properties, point out the weaknesses in available algorithms, and to develop a method of generating Bessel functions which is free of these weaknesses.

Basic Properties

A continued fraction may be written as

$$f = a_0 + \cfrac{b_1}{c_1 + \cfrac{b_2}{c_2 + \cfrac{b_3}{c_3 \dots}}} \quad (2)$$

which can be rewritten as

$$f = a_0 + \frac{b_1}{c_1} + \frac{b_2}{c_2} + \frac{b_3}{c_3} + \dots \quad (3)$$

The n^{th} approximate convergent to the continued fraction representation of f is written as

$$f_n = a_0 + \frac{b_1}{c_1} + \dots + \frac{b_n}{c_n} \quad (4)$$

Continued fractions may be generated from a three-term recursion relation in a simple way:

$$\begin{aligned} \frac{J_{v-1}}{J_v} &= \frac{2v}{x} - \frac{J_{v+1}}{J_v} = \frac{2v}{x} - \frac{1}{\frac{2(v+1)}{x} - \frac{J_{v+2}}{J_{v+1}}} \\ &= \frac{2v}{x} - \frac{1}{\frac{2(v+1)}{x}} - \frac{1}{\frac{2(v+2)}{x}} - \dots \end{aligned} \quad (5)$$

So

$$\frac{J_{v-1}}{J_v} = 2vx^{-1} - \frac{1}{2(v+1)x^{-1}} - \frac{1}{2(v+2)x^{-1}} - \dots \quad (6)$$

This form is one of a simple continued fraction which may be defined as

$$f(x) = a_1 + \frac{1}{a_2} + \frac{1}{a_3} + \frac{1}{a_4} + \dots + \frac{1}{a_n} + \dots \quad (7)$$

where $a_1 \neq 0$ and the a 's may be negative.

Equation (7) may be written in the more convenient notation of

$$f(x) = [a_1, a_2, a_3, \dots] \quad (8)$$

The n^{th} convergent is written in like manner:

$$f_n(x) = [a_1, a_2, a_3, \dots, a_n] \quad (9)$$

It has been shown by Wall [5] that all continued fractions may be expressed as simple continued fractions of the above form. In addition, Watson [6] has shown that the form of the continued fraction for Bessel functions is unique, requiring that all the n^{th} convergents of the continued fraction in whatever form have the same numerical value. For example, all of the following are equivalent in the n^{th} convergent:

$$\frac{J_v}{J_{v-1}} = \frac{1/2 \ x/v}{1} - \frac{1/4 \ x^2/(v[v+1])}{1} - \frac{1/4 \ x^2/([v+1][v+2])}{1} - \dots \quad (10)$$

$$\frac{J_v}{J_{v-1}} = \frac{1}{2vx^{-1}} - \frac{1}{2(v+1)x^{-1}} - \dots \quad (11)$$

$$\frac{J_v}{J_{v-1}} = \frac{x}{2v} - \frac{x^2}{2(v+1)} - \frac{x^2}{2(v+2)} - \dots \quad (12)$$

Algorithms

It is now possible to generate the ratio of Bessel functions by starting with the last value on the right of Eq. (9) and working backwards to a_1 . However, the minimum necessary value of n must be specified before the computation starts, since adding one term means the re-computation of the entire fraction. Gautchi [3] has made an estimate of the value of n for determining Bessel functions to a given accuracy. This method does not apply in general to continued fractions and is only an approximate estimate which is difficult to apply. Moreover, the tail-to-head method suffers somewhat from roundoff error when the difference between two values is near zero.

Another method of computing J_{v-1}/J_v follows logically from the relations

$$\begin{aligned} p_n &= a_n p_{n-1} + p_{n-2} \\ q_n &= a_n q_{n-1} + q_{n-2} \end{aligned} \tag{13}$$

so

$$\frac{p_n}{q_n} \equiv [a_1, a_2, \dots, a_n] \tag{14}$$

where p_n is the n^{th} partial numerator and q_n the n^{th} partial denominator of the n^{th} convergent.

Wall [5] has shown that these relations are generally true for any continued fraction. Starting with the initial values of $p_1 = a_1$, $q_1 = 1$, $p_0 = 1$, and $q_0 = 0$, one can generate successive approximants to the exact infinite continued fraction until the desired accuracy is obtained. This method is illustrated in Telchroew [7] and Abramowitz [1]. The former has noted that the values of p_n and q_n may grow so large as to cause overflow in the computer. Moreover, for negative a_m an initial number of digits may cancel, causing loss of accuracy in the m^{th} convergent in exactly the same way as the original recursion relation (Eq. (1)). This forward ratio method leaves much to be desired.

By noticing that the relations in Eq. (13) are themselves recursion relations, one obtains a new method of generating Bessel functions:

$$\frac{p_n}{p_{n-1}} = a_n + \frac{p_{n-2}}{p_{n-1}} = [a_n, a_{n-1}, \dots, a_2, a_1]$$

$$\frac{q_n}{q_{n-1}} = a_n + \frac{q_{n-2}}{q_{n-1}} = [a_n, a_{n-1}, \dots, a_2] \quad (15)$$

Note that the relation for q_n/q_{n-1} starts with a_2 rather than a_1 because $q_0 = 0$.

$$\frac{\frac{p_n}{p_{n-1}}}{\frac{q_n}{q_{n-1}}} = \frac{\frac{p_n}{q_n}}{\frac{p_{n-1}}{q_{n-1}}} = \frac{[a_n, a_{n-1}, \dots, a_1]}{[a_n, a_{n-1}, \dots, a_2]} \quad (16)$$

So the value of p_n/q_n is given by

$$\frac{p_n}{q_n} = \frac{[a_n, \dots, a_1] [a_{n-1}, \dots, a_1] \dots [a_1]}{[a_n, \dots, a_2] [a_{n-1}, \dots, a_2] \dots [a_2]} \quad (17)$$

Eq. (17) gives the value of the n^{th} approximant to the exact continued fractions representation for a particular continued fraction. When the ratio

$$\frac{\frac{p_n}{q_n}}{\frac{p_{n-1}}{q_{n-1}}} - 1 < \epsilon \quad (18)$$

where ϵ is the maximum allowable error, the product can be terminated since all subsequent ratios will be unity. Eq. (17) gives a simple method of computing the ratios of Bessel functions of successive order to the number of significant digits in the computer. The specific formula for the Bessel function is

$$\frac{J_{v-1}}{J_v} = 2vx^{-1} + \frac{1}{-2(v+1)x^{-1}} + \frac{1}{2(v+2)x^{-1}} + \frac{1}{-2(v+3)x^{-1}} + \dots \quad (19)$$

Every other a_n is negative in Eq. (17), but the application is unchanged. Each numerator and denominator is generated from the preceding one by taking the reciprocal and adding the next a_n :

$$\frac{J_{v-1}}{J_v} \approx \frac{[2(v+2m)x^{-1}, -2(v+2m-1)x^{-1}, \dots, 2vx^{-1}] \dots [2vx^{-1}]}{[2(v+2m)x^{-1}, -2(v+2m-1)x^{-1}, \dots, -2(v+1)x^{-1}] \dots [-2(v+1)x^{-1}]} \quad (20)$$

Since both the numerators and denominators alternate in sign, it is simpler to consider all a_n positive, and to generate each successive term by taking the reciprocal and subtracting from the next a_n . The n th approximate convergent is the product of all the preceding ratios, and the fraction terminates when the n th ratio in Eq. (18) is unity.

It may be noted that the order of the terms in the simple continued fraction has been reversed between Eqs. (8) and (17). This means that it is not necessary to decide how many terms are desired before the computation, as in Eq. (9). Because the successive numerators and denominators of Eq. (17) are tending toward the same finite value, there is no large growth in the numerator and denominator as in the use of Eq. (13).

An advantage that is not immediately apparent is that a particular n th convergent being near zero or very large is no disadvantage. Although the computed n th approximant will deviate slightly from the theoretical value, the n th convergent will converge back to the correct value. In other words, the n th approximant is slightly self-correcting.

The continued fraction converges very quickly and does not require significant storage. This first ratio usually requires the largest number of terms, and for $x = 1.0$ and $v = 1.5$ with 64-bit capacity, only nine terms are needed. A sample calculation follows:

$$x = 1.0 \quad v = 9.5$$

$$\frac{J_{v-1}}{J_v} = \frac{(19) (20.94736842) (22.95226131) (24.95643131) (26.95993017)}{(21) (22.95238095) (24.95643154) (26.95993017)}$$

$$= 18.95228198 \quad (21)$$

This value is identical to the handbook value [1].

The development has made no restrictions on the form of the argument or order, so they can both be complex and positive or negative. Near zeros of the Bessel functions it should be noted that the accuracy may drop to ten places rather than ten significant digits. The actual spherical Bessel functions rather than their ratios as in Eq. (19) are found from

$$j_0(x) = \sqrt{\frac{\pi}{2x}} J_{1/2}(x) = \frac{\sin(x)}{x} \quad y_0(x) = \sqrt{\frac{\pi}{2x}} J_{-1/2}(x) = \frac{-\cos(x)}{x}$$

$$j_n(x) = \frac{J_{n+1/2}}{J_{n-1/2}} \frac{J_{n-1/2}}{J_{n-3/2}} \dots J_{1/2} \sqrt{\frac{\pi}{2x}}$$

$$y_n(x) = \frac{J_{-n-1/2}}{J_{-n+1/2}} \frac{J_{-n+1/2}}{J_{-n-3/2}} \dots J_{-1/2} \sqrt{\frac{\pi}{2x}} \quad (22)$$

ACCURACY

A comparison between the accuracy of a double precision 64-bit and single precision 32-bit program was made for the real values of argument tabulated in Abramowitz [1]. The agreement between the double precision routine and the handbook was exact for 10 significant digits for all arguments. By comparing the single precision version to the double precision version, it is estimated that the last four of the 16 digits would be susceptible to machine roundoff. Therefore, the table is reproduced to 10 digits to allow for the additional possibility of roundoff error for all arguments.

OTHER FUNCTIONS

Many known functions have been expressed in terms of continued fractions, and they may be evaluated by Eq. (17). Abramowitz [1] has listed one form of a continued fraction representation for most of the

functions in his handbook. The form of any continued fraction may be changed to that of Eq. (7) by the following transformations:

$$f(x) = a_0 + \frac{b_1}{c_1} + \frac{b_2}{c_2} + \dots = a_0 + \frac{d_1 b_1}{d_1 c_1} + \frac{d_1 d_2 b_2}{d_2 c_2} + \frac{d_2 d_3 b_3}{d_3 c_3} + \dots \quad (23)$$

The only requirement is that a_0 be nonzero; if a_0 is zero, this requirement may be met by taking the reciprocal of the continued fraction.

The continued fraction technique will converge with fewer terms than any other current method and is specifically adapted to machine computation. Although mathematically equivalent to recursion relations, the continued fraction technique gains accuracy from the fact that the product of two numbers in the computer does not lose accuracy, as does the difference of two numbers.

ACKNOWLEDGEMENTS

I would like to express my thanks to Mr. G. B. Hoidale for his numerous suggestions and recommendations on this manuscript. I would especially like to thank Mr. G. Ethridge for his exhaustive checking of the tables and the formulas in this paper.

APPENDIX A

USE OF THE TABLES

The following tables contain 100 orders of spherical Bessel functions of the first and second kind for the same argument on the same page. The real and imaginary parts of the spherical Bessel functions of the first kind $j_n(x) = \sqrt{\frac{2}{x}} j_{n+\frac{1}{2}}(x)$ are presented on the left side with the appropriate order n , and the spherical Bessel functions of the second kind $y_n(x) = \sqrt{\frac{2}{x}} y_{n+\frac{1}{2}}(x) = (-1)^{n+1} \sqrt{\frac{2}{x}} j_{-(n+\frac{1}{2})}(x)$ are in like manner on the right side of the page.

Beyond the 20th order, the missing orders can be found by a downward recursion for $j_n(z)$ and by an upward recursion for $y_n(x)$. The spherical Bessel functions of the complex conjugate of the argument presented here can be found by taking the complex conjugate of the results in the Table. Since these Tables are intended as check values, interpolation should not be attempted between values of argument.

In those few cases where the value of the spherical Bessel functions exceed $10^{\pm 300}$ a scale factor of 10^{+300} was multiplied by the $j_n(x)$ and 10^{-300} was multiplied by the $y_n(x)$. These scale factors are indicated by a sudden break in the order of magnitude with increasing n since the initial values never exceeded the scale factor.

Many of the more useful relations among the spherical Bessel functions may be found in Abramowitz [1]. If these relations are used to check the table, it should be noted that the initial values of j_0 and y_0 are given by Eq. (22) and that the last or highest order being correct depends on all the lower orders being correct.
